APPROXIMATE MEAN
DECLINATION 1909

Scale $\frac{1}{48000}$

The figure consists of three horizontal number lines stacked vertically, illustrating the conversion of 4 miles into feet and then into kilometers.

- Top Number Line (Miles):** Labeled "Miles" at the right end. It has major tick marks at 1, $\frac{1}{2}$, 0, 1, 2, 3, and 4. The segment from 0 to 1 is divided into two equal parts by a tick mark at $\frac{1}{2}$.
- Middle Number Line (Feet):** Labeled "Feet" at the right end. It has major tick marks at 4000, 2000, 0, 4000, 8000, 12000, and 16000. The segment from 0 to 4000 is divided into two equal parts by a tick mark at 2000.
- Bottom Number Line (Kilometers):** Labeled "Kilometers" at the right end. It has major tick marks at 1, $\frac{1}{2}$, 0, 1, 2, 3, and 4. The segment from 0 to 1 is divided into two equal parts by a tick mark at $\frac{1}{2}$.

Vertical dashed lines connect the corresponding tick marks across the three number lines, showing the alignment of the measurements. For example, the 0 mark on the miles line aligns with the 0 mark on the feet line and the 0 mark on the kilometers line. The 4-mile mark aligns with the 16000-foot mark and the 4-kilometer mark.

Contour interval 20 feet.
Datum is mean sea level.
